

Clone repo, go inside wordcount directory and run:

```
docker compose up -d --build
```

Then you can use following to double check all containers running:

```
docker compose ps
```

Then run a command example as (can change keyword 'hello' and text 'sample.txt'):

```
docker compose exec client python client.py hello sample.txt
```

To see server logs call:

```
docker compose logs server
```

To investigate REDIS run following two commands one by one:

```
docker compose exec redis redis-cli
```

```
KEYS wc:*
```

You will see keys, to see value of a key enter (or any other key pair), exit command to leave:

```
GET wc:sample.txt:hello
```

For benchmark run (csv saved in results directory):

```
docker compose exec client python benchmark.py
```

Then generate graphs (saved in results directory):

```
docker compose exec client python plot_results.py
```

To close:

```
docker compose down
```
